

ACSiNet Multicast IP Addresses

Multicast IP addresses used in ACSiNet technology for control, synchronization, and audio transmission services over the network.

Ref: D-032809-EN-r00

1. DESCRIPTION

The following document contains the complete list of IP multicast addresses used by ACSiNet technology and the AES67 protocol.

2. MULTICAST ADDRESS

2.1 AES67/ACSiNet IP Common Usage

These addresses will be present whenever there is AES67 and ACSiNet multicast network traffic.

These addresses are reserved and are used automatically when the corresponding protocol is initiated on any device.

- **PTPv2 protocol:** Used for precise clock synchronization between devices on the network. Essential for the transmission of IP audio networks under AES67 standard.
- **IGMPv2 protocol:** Manages network device subscriptions to multicast groups. Optimize data and audio transmission over multicast traffic using IGMP Snooping and IGPM Querier.
- **LDA Discovery Service:** Communication between LDA devices within the same network that allows them to be automatically detected and communicated.

MULTICAST IP ADDRESS	MULTICAST MAC ADDRES	USAGE
224.0.1.129	01:00:5E:00:01:81	PTPv2 protocol
224.0.0.1	01:00:5E:00:00:01	IGMPv2 protocol
224.0.2.11	01:00:5E:00:02:0B	LDA Discovery Service

2.2 ACSiNet IP Specific Usage

The following address register is used in communication between devices configured as Senders and their Receiver.

Each set of addresses is linked to an identifier, ID, composed of a Control address and 16 Audio addresses.

All devices, Sender or Receiver, belonging to the same Domain or Cluster must share IDs to establish communication.
